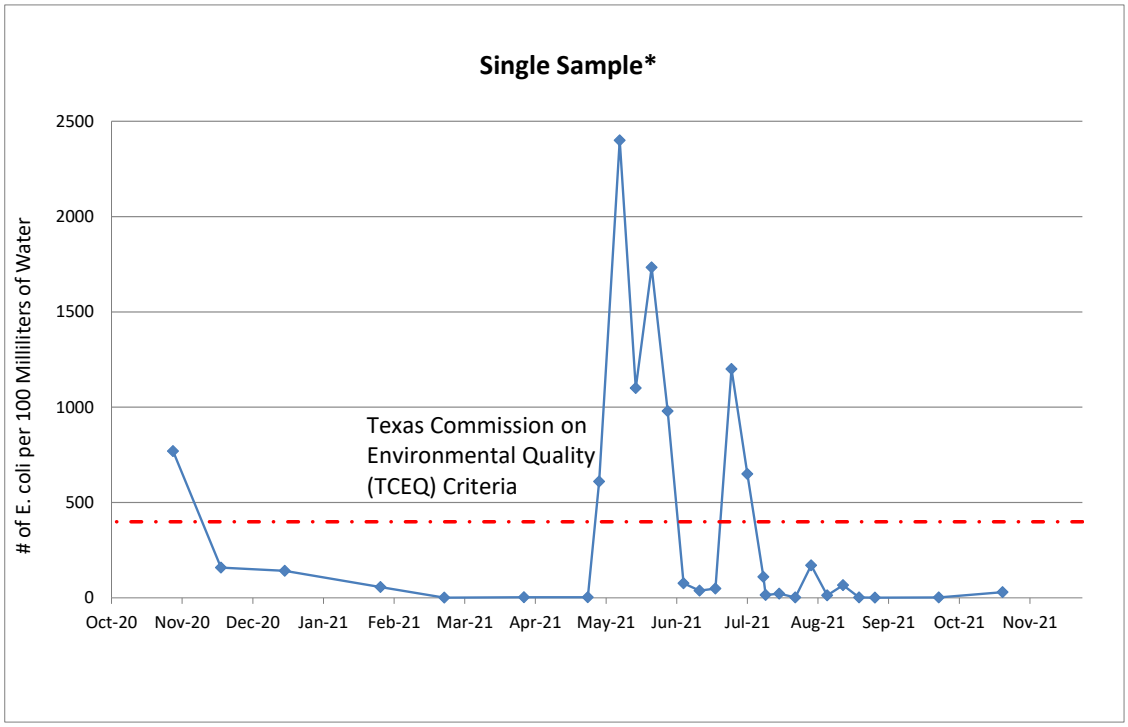
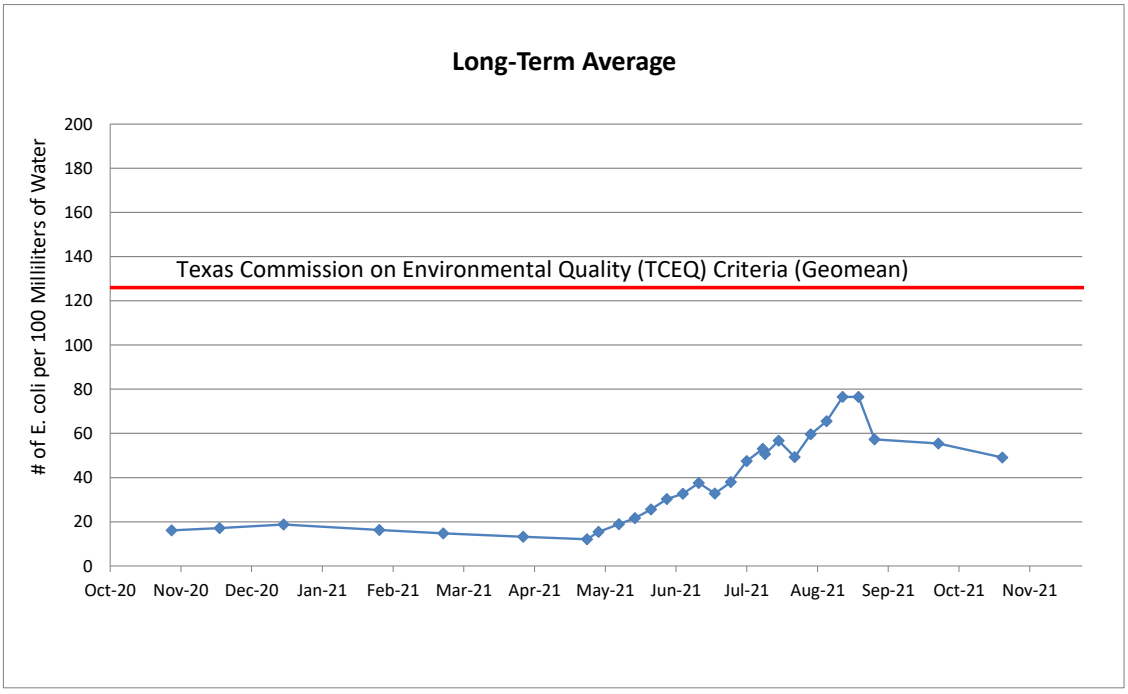
# West Fork Trinity @ Operations Dam

* Site is sampled weekly May-August and monthly September-April





The Texas Commission on Environmental Quality considers a body of water acceptable for swimming, tubing, or boating when the long-term average bacteria concentration is below 126 bacteria per 100 milliliters of water and when a single sample is below 399 bacteria per 100 milliliters of water. Just like every other river in the state, levels may sometimes exceed these standards especially during and after a rainfall. Click here for more information:
